

# **ABSTRACT**

Circuit for the Generation of Electric Power induced to  
bear opposite polarity in the Pulsating D.C. power supply  
whereby electric power of opposite polarity is generated the  
moment the D.C. pulsating power that is being delivered is  
suspended, by means of an induction device in series with or  
in parallel with the load, or alternatively by means of an LC  
parallel circuit which is in series with or in parallel with  
the load, and the power of opposite polarity thus generated  
is fed to the load, highlighted in substantial cut in production  
cost with enhanced operational reliabilities.
